

COMPONENT-BASED DISTRIBUTED LEARNING MANAGEMENT ARCHITECTURE

Abstract of the Invention

The present invention provides a distributed learning management architecture that is “componentized” for increased distribution and scalability. Specifically, the present invention provides an architecture in which multiple content servers, delivery servers and/or live session servers can be provided to accommodate multiple geographic locations. The present invention further provides an off-line learning architecture that allows the teachings of the distributed learning management architecture to be implemented on an individual client.
